MAIN ADVANTAGES

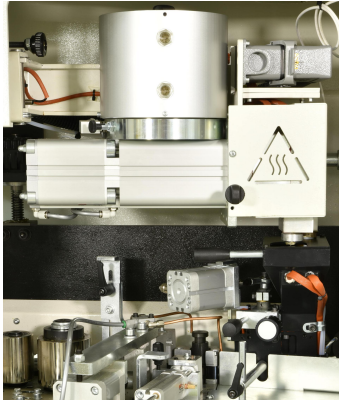

A single pot for different glue types

The quick and easy cleaning of the glue pot is carried out directly in the machine allowing the application of different glues by using one single pot and without external cleaning benches.

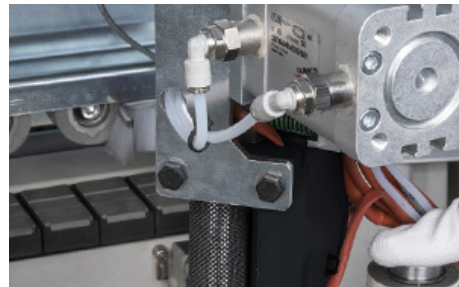

Precise and simple setting of the glue quantity spread on the panel for a perfect joint line in all working conditions.

Design always at the highest levels, with a perfect gluing of the edge with an invisible glue line.

High glue quality and uninterrupted processing with the **QMS-P premelter**, that automatically fills the glue pot only when needed.

Homogeneous spreading over time thanks to the exclusive glue closing device placed before the roller (**SCM patent**), and without scrapers that rest on the roller avoiding the problem of the carbonization and the leakage of glue.

Ergonomic and accessible, the glue pot has a quick-release device with the setting for its correct repositioning, which makes the replacement operation quick and without further adjustments.
